# Placement, Drugs and Therapy... We Can Do Better

www.seniorsadvocatebc.ca 1-877-952-3181 Report # 3 April 2015

Dear British Columbia Senior,

There are over 25,000 B.C. seniors living in residential care and over 29,000 who are receiving home care. While this is only seven percent of seniors, together these two groups represent our most frail and vulnerable seniors. As such, we must ensure that we are properly monitoring their health status and their care needs.

During this first year as Seniors Advocate, one of my key priorities has been to obtain and analyze information that will help us understand the needs of our most vulnerable seniors and how well we are meeting their needs. Part of this will be achieved through standardized client/resident experience surveys my office is conducting. We will be surveying all 339 publicly-funded residential care facilities and 29,000-plus home support clients, including family members. Complementing this will be the health assessment data my office has obtained and initially analyzed, with the findings in this report.

This report, *Placement, Drugs and Therapy...We Can Do Better,* is produced as part of my mandate under the Seniors Advocate Act, to report publicly and independently on systemic issues that affect seniors. The findings in this report highlight three systemic issues I have identified:

- inappropriate placement in residential care of higher functioning seniors who could live more independently with changes to home care and assisted living;
- the overuse of both antipsychotics and antidepressants in residential care;
- the significant gap in the level of rehabilitative therapies in B.C. residential care facilities relative to other provinces.

These findings demonstrate more work is needed to better serve seniors. I will be working with health authorities, service providers and physicians to effect changes that will ensure seniors are in the right place, getting the right drugs, and receiving the right kind of therapies that best suit their needs. As always, I welcome all feedback from seniors and their family members as together we address these issues.

Sincerely,

Isobel Mackenzie

Seniors Advocate Province of British Columbia

#### Introduction

All B.C. seniors admitted to publicly-funded residential care or assisted living, and those who receive home care, are assessed using an internationally recognized suite of assessment tools: The InterRAI Resident Assessment Instrument-Home Care (RAI-HC) and the InterRAI Resident Assessment Instrument-Minimum Data Set 2.0 (RAI-MDS 2.0).

The InterRAI Resident Assessment was originally developed in the 1980s in response to concerns about the quality of care in U.S. nursing homes. Since that time the "RAI", as it is colloquially known, has been implemented throughout the world. Early in the new millennium, in response to the growing use of home care, a version of RAI was created to assess those receiving home care services in the community. From a diagnostic perspective, the differences between the Home Care and Residential Care RAI are small. For brevity, one sample, the RAI-HC, is included in Appendix 1.

In Canada, the expertise in application, interpretation and Canadian design of the RAI is housed at the University of Waterloo, and the central repository for all RAI data is the Canadian Institute of Health Information (CIHI), an independent research body.

In the case of British Columbia's 31,084 home care clients (90% seniors), the RAI is normally completed at intake, at least annually, and whenever a major change has occurred. In the case of the province's 29,429 residential care clients (95% seniors), the RAI is undertaken when a senior enters a residential care facility and at least quarterly for each resident. These repeat assessments are invaluable in helping to guide the creation of appropriate care plans as well as to measure and track changes in the individual's health status over time.

www.interrai.org www.cihi.ca

In addition to its value for the individual care plans for home care clients or residents, the RAI also provides a profile of health status capturing the needs, strengths and preferences of care recipients on a facility, health authority and provincial level. These tools assess, in a standardized way, multiple facets of an individual's health care status and their ability to be independent, including their medical conditions, medications, supports, cognition, psychological state, physical ability and ability to perform various daily tasks. With these data, we gain a complete and compelling composite of who is receiving home care and who is living in residential care.

The RAI also tracks a number of indicators that can be used to help determine if the supports needed are being provided and if the care is appropriate. Examining the frequency of physical therapy or recreational therapy along with the number of falls and use of medications can be helpful in providing a picture of some of the activities and practices in residential care facilities and the amount of home care provided relative to the assessment of need.

British Columbia has been using the RAI in residential care since 2009 and for home care since 2005. This was later than some

other jurisdictions in Canada and it therefore limits the ability to monitor change over time retrospectively. However, it is now being collected and baseline data will allow us to measure progress going forward.

The Province does not currently require facilities or health authorities to report their RAI data for residential care. For home care the Province receives reporting from health authorities on only six outcome measurements under what is called "Minimum Reporting Requirements" (MRR), and these results are not published.

The Office of the Seniors Advocate (OSA) identified as a priority the gathering of RAI data to help inform B.C. seniors and their families as well as policy makers at both the provincial and health authority level. The OSA retained expertise from the University of Waterloo and worked with the Canadian Institute of Health Information (CIHI) to secure the complete data on home care and residential care for British Columbia while securing agreement to compare residential care aggregate data with Alberta and Ontario.

The information contained in these data reports is vast. The purpose of this report is not to provide a comprehensive analysis of all possible issues raised in the RAI data; the OSA will continue to analyze these data to look for emerging systemic issues. This initial report is intended to inform the public of the existence of these data and to highlight three systemic issues that are of immediate concern to the Advocate:

- Premature admissions to residential care of up to 15 percent of residents in care facilities;
- 2. The overuse of drugs in care facilities;
- 3. The lack of physiotherapy and recreational therapy in B.C. care facilities.

Initial analysis of the RAI data examined the characteristics of seniors in residential care and home care. The table below provides a snapshot based on some of the key indicators that can help us develop a picture of who is living in residential care and who is receiving home care.

Appendix 2 contains more comprehensive data for the 2012-13 for home care in B.C. and the 2013-14 Quickstats to compare B.C. with Alberta and Ontario for residential care. More complete residential care data, available for 2012-13 was used for this report unless otherwise stated.

Snapshot of care in B.C.	Home and Community Care population (31,084 individuals)	Residential Care population (29,429 individuals)
average age	80 years	85 years
female	64%	65%
85 and older	40%	59%
married	30%	24%
diagnosis of dementia	34%	61%
primarily uses a wheelchair	11%	50%
moderate to severe cognitive difficulties (memory, following direction)	19%	64%
six or more medical diagnoses	21%	13%
moderate to severe difficulties in independently performing daily living tasks	15%	70%
instability in cognitive function, ADLs, mood or behaviour	50%	44%
caregiver co-resides	45%	n/a
taking 9 or more medications	44%	51%

These data confirm some of what we expected to find, but also highlighted a few surprises. For example, the majority of both home care clients and care facility residents are female, reflecting the longer life expectancy for females, and the average age in residential care is higher than for those receiving home care. We also noted higherneed home care clients were more likely to co-reside with their caregiver.

Among the surprises, however, was the degree to which there was similarity between those in residential care and those receiving home care. Most notably, there were very similar rates of seniors taking multiple medications, as well as similar rates of seniors with instability in their cognitive function or mood and/or in their ability to perform the activities of daily living (ADLs) in both residential care and home care.

Also surprising was the apparent complexity of health conditions among clients in the community, including a higher percentage of clients with six or more medical diagnoses than residential care.

It was also surprising to compare ourselves with Alberta and Ontario and find that those provinces have a higher percentage of seniors living in residential care who are frailer and have more complex care needs. This means B.C. has seniors in residential care who would be living in the community (with support) or assisted living if they lived in Ontario or Alberta. Having said that, these data do indicate that we can, and do, care for highly complex clients in the community, just not consistently. The chart below illustrates that there are some seniors cared for in the community at high levels of impairment.

Seniors in	the community under home care
34%	have a diagnosis of Alzheimer's or other dementia
10%	are in renal failure (on dialysis)
21%	have a psychiatric or mood disorder
15%	have very limited function for Activities of Daily Living (ADL)
19%	have significant to severe cognitive impairment
47%	experience daily pain
44%	are on nine or more medications
50%	have an unstable diagnosis for cognition, mood or behavior
21%	are incontinent
19%	have nursing visits once a week or more

These data clearly tell us that we can care for significant levels of both cognitive and physical impairment in the community either in an assisted living setting or independent housing. This is crucial to understand as we look at the profile of seniors who are in residential care.

### 1. Appropriate Placement in Residential Care

Most seniors express a strong desire to live as independently as possible. To achieve this objective, we must be certain that all possible community supports such as home care and assisted living are exhausted before seniors are moved to residential care. The RAI data indicates this is not always the case and there are some seniors in residential care who could, based on their assessment, be living in the community with the appropriate home care, or in assisted living.

Using the expertise of one of Canada's foremost RAI researchers from the University of Waterloo, the OSA examined the RAI data more carefully with a view to identifying those seniors living in residential care who, based on their assessed levels of physical and cognitive function, might be able to live more independently. What emerged from the analysis are three distinct profiles of seniors who could likely be cared for either at home or in assisted living.

The first profile is of seniors with light care needs who can make their own decisions, are not at risk of wandering or getting lost, and can manage their own activities of daily living (ADLs) with minimal assistance. This profile can be referred to as having **light physical and cognitive care needs**. This group is easily cared for in the community with community care – if appropriate care is available.

The second profile is of seniors with a mild dementia and who need some assistance with ADLs, but who otherwise manage well with direction and support. This group can be seen as having **dementia care needs**. These are seniors who might do very well in assisted living with monitoring supports or indeed could remain at home with home supports and some of the electronic monitoring that is now widely available.

The third profile is of seniors who are moderately physically frail and in need of assistance for physical tasks and ADLs, but who are mentally intact and self-directing. This profile can be characterized as having **physical care needs**. This is a population that can easily be cared for at home or assisted living. Key to this is their ability to direct and have an awareness of their care needs. Those with high physical care needs and high cognitive function are successfully integrated in the community in young age groups and the supports that enable independence for younger populations should be equally available to seniors. With these three profiles in mind, researchers checked the residential care RAI data to see if there were seniors who fit these profiles who were currently living in residential care. The results were surprising: it appears from these data that somewhere between five and 15 per cent of the seniors living in B.C. residential care fit one or more of these profiles -- that is 1,500 to 4,400 individuals who could potentially live more independently. Comparisons with Alberta and Ontario, where there is a significantly lower percentage of residents fitting these profiles, confirm there is room for improvement in B.C.

Three client profiles identified and their prevalence among the residential care population of B.C., compared to populations in Alberta and Ontario

		age of the client pop	residential ulation
RAI Client Profile	B.C.	AB	ON
Profile 1: LIGHT PHYSICAL AND COGNITIVE CARE NEEDS These seniors have relatively low care needs with relatively high levels of both cognitive and physical function compared to the general residential care population. Interestingly, of the three profiles, this group has the highest representation among B.C.'s residential care client population. In Alberta, these seniors may be accommodated in that province's expanded assisted living system.	6.1%	2.3%	5.6%
Profile 2: DEMENTIA CARE NEEDS This population has cognitive impairment that can make it challenging for them to live alone, but they have low physical care needs and low medical needs. These seniors are much less likely to reside in residential care settings in Alberta or Ontario and are more likely to be in assisted living or have home care.	5.4%	0.9%	1.8%
Profile 3: HIGHER PHYSICAL CARE NEEDS This group has somewhat higher physical care needs than the other two groups but, in all other respects, could potentially receive care in the community. This is a group for whom services such as physiotherapy (PT) and occupational therapy (OT) are key.	4.7%	1%	3%

The seniors fitting these three profiles have lower care needs than residential care is designed to accommodate and, based on their health, their abilities, and their care needs, these seniors could be cared for in other settings, either at home with support or in an assisted living environment rather than a residential care setting.

To be housed prematurely in a residential care facility is not generally a good experience, or fit, for the resident. With most residents experiencing complex and severe cognitive and/or physical impairment, it is difficult to form a community of interest.

It is generally accepted that community placement with supports is more desirable for those with lower care needs or who have full cognitive function. It also ensures that the scarce residential care bed is available for someone whose needs are a fit with residential care.

Residential Care is "home" for the seniors who live there. It is vital, therefore, that it serve as the appropriate type of housing for the senior who lives there. Given the results of these data, the Advocate has included an examination of this issue in her report on the affordability, availability and appropriateness of seniors' housing.

#### 2. The Appropriate Use of Medication

One of the striking numbers in these data is the percentage of seniors both in residential care and home care who are taking nine or more medications. Fifty-one percent of residents in B.C. care facilities are taking nine or more different medications, and this drops by only seven per cent for seniors receiving home care, with 44 per cent taking nine or more medications.

The challenge around medications is twofold. For home care clients, the managing of medications is particularly problematic. The number one reported critical incident in home care is medication error. In terms of both home care and residential care clients, there is the issue of the appropriateness of the medication for the condition being treated.

The issues around potential adverse effects of medications and drug interactions among medications are well-known. Older people are more susceptible to the effects of many drugs: the medications tend to remain in their bloodstreams for longer, reach higher concentrations, and may result in unique sensitivities and side effects. Because of these effects, which are due to various agerelated changes in older people, certain medications should be avoided, or used cautiously with ongoing and careful monitoring. Taking many drugs at the same time, often referred to as polypharmacy, should be minimized as much as possible. The RAI reports on the use of one specific classification of drugs: psychotropic medications are drugs that alter chemical levels in the brain and are used to treat a wide range of conditions, including psychosis, depression and anxiety. They are commonly prescribed to seniors in both community care and residential care settings but, in general, seniors in residential care are more likely than those who are cared for at home to be taking these medications.

The RAI breaks down psychotropic medications, intended to be used for a specific diagnosis, into five distinct types:

- 1. Antipsychotic
- 2. Antianxiety
- 3. Antidepressants
- 4. Hypnotic
- 5. Analgesics

One clear indicator of potentially inappropriate medication use in residential care facilities is the extent to which one particular type of psychotropic medication, antipsychotic drugs, is prescribed to seniors without their having a diagnosis of psychosis, which is the diagnosis for which these drugs are designed. It is well-known that these drugs are sometimes used to manage aggressive or agitated behaviours in residents who have dementia. This was not what they were intended to treat, nor are there robust clinical trials involving frail seniors to properly monitor side effects.

Previous CIHI research has found that, Canada-wide, one in three long-term care

facility residents is taking antipsychotic drugs without a clinical diagnosis of psychosis, and that the use of antipsychotics is nine times higher in residential care populations than among home care populations. The B.C. RAI data shows that only four per cent of seniors in residential care have a diagnosis of a psychiatric disorder, yet 34 per cent of this client group are prescribed antipsychotic medications. This is a clear indicator that these medications are being used to treat other, non-psychotic conditions, and are probably a tool to treat behaviour issues related to cognitive or mood disorders rather than actual psychotic disorders.

Antipsychotic medications can have significant side effects including sedation, cognitive impairment, metabolic changes, muscle and movement disorders, and may also increase the risk of diabetes. Therefore, it is important that these medications not be prescribed unnecessarily to seniors whose medical conditions or behavioural symptoms are treatable through other means.

Not only can the side effects from antipsychotics range from unpleasant to

debilitating, they can also lead to misdiagnosis of conditions such as dementia and Parkinson's, which would result in more wrongly prescribed drugs.

This overuse of antipsychotic drugs has been raised before. In 2013, the BC Care Providers issued a report, Best Practices Guide for Safely Reducing AntiPsychotic Drug Use in Residential Care. Indeed, there is evidence to support that the overall use of antipsychotics in B.C. has been reduced. The 2011 Ministry of Health report Review of the Use of Antipsychotic Drugs in British Columbia Residential Care Facilities showed levels as high as 50 per cent of residential care patients were prescribed an antipsychotic in 2010/11. Despite the laudable reduction from 50 per cent to 34 per cent, the RAI comparison demonstrates B.C. still has a slightly higher use than Alberta and Ontario. Clearly, there is more work to be done.

Depression is the most common mental health problem among the elderly, and our

examination of the RAI data echoes this: 24 per cent of the province's residential care clients, and approximately 21 per cent of the home care clients, were assessed as having a diagnosis of depression. As with antipsychotics, antidepressant prescriptions outpace depression diagnoses: while 24 per cent of residential care clients are assessed with depression for example, a full 47 per cent are prescribed antidepressant medications.

Although this difference between diagnosis and prescription does not seem to be as great as with the use of antipsychotics, it is still a sizable gap. Some antidepressants, particularly the newer class of serotonin reuptake inhibitors (SSRIs), may have more side effects than others, including agitation, dizziness which can lead to falls, and drowsiness; for this reason, seniors who are prescribed antidepressants should be monitored closely and other treatment options considered.

Incidence of psychiatric disorders and mood disorders with medication prescriptions, B.C. residential care population

A related question, and one not answered by the RAI data, is whether seniors under home care and residential care who are assessed as being depressed actually fit the clinical diagnosis of depression in terms of the chemical changes that antidepressant medications are designed to treat. If a senior does not have these chemical changes, but is instead exhibiting a wholly appropriate behavioural response to changes in their health, mobility and independence, then perhaps antidepressants are not the most appropriate treatment for these seniors. Correct diagnosis is crucial.

The Advocate will continue to raise awareness of the issues around overmedication and will monitor the RAI data to look for improvements. Involvement of residents and family members in the decision of which medications residents should be taking and whether or not potential side effects are sufficiently explained is something the Advocate will be testing for in the standardized, comprehensive Residential Care survey the Office of the Seniors Advocate will be administering to all 339 B.C. publicly-funded residential care facilities.

## 3. The Appropriate Amount of Rehabilitation Therapy

The provision of physiotherapy, occupational therapy, speech language therapy and recreational therapy is crucial to the maintenance of function and independence for frail seniors. In all populations, the positive effects of exercise and movement are wellknown and it is even more so for seniors. Emerging research has shown that, among seniors, cognitive functioning is positively impacted by physically engaging activities, and that those seniors who have some level of cognitive impairment particularly benefit from both social and physical activity. Given this knowledge, it is disappointing to see the extent to which B.C. lags behind both Ontario and Alberta in the provision of these supports.

The importance of physiotherapy (PT) cannot be minimized. Physiotherapists work with seniors to improve their strength, motor function and balance. Simple things like being able to transfer in and out of bed safely and frequently can easily become impossible with the deconditioning that happens with frail seniors if they are bedbound from a bout of flu or a fracture. With the work of physiotherapists, seniors can learn the techniques they should use in ambulation, the exercises that will restore strength and function and the warning signs of when they are pushing themselves too far or not using proper body mechanics.

All evidence supports how crucial a factor time can be in determining the extent to which a frail senior will recover from a period of inactivity or a traumatic event such as a stroke or a fall. The earlier physiotherapy begins, the greater the likelihood of regaining maximum function.

Occupational therapy (OT) ensures appropriate adaptations to the environment,

aids and techniques a senior uses to maintain and improve their ability to perform daily tasks. Having a walker set at the correct height or proper seating in a wheelchair can make the difference between maximum function or chronic pain. This is part of the work of an OT.

Occupational therapists also focus on identifying physical and cognitive strengths so that these can be integrated into a rehabilitation plan that maximizes what seniors can do for themselves in all aspects of daily life. OTs also help staff adopt care techniques that not only support the senior's independence but also facilitate staff safety when providing physical care to the senior.

Speech therapy is used mostly in the recovery from strokes, but also plays a critical role in supporting seniors with swallowing disorders. These are crucial to functions that affect a senior's quality of life.

Recreational therapy is key to ensuring that seniors in residential care are engaged in meaningful social activities with others that stimulate the mind and help maintain physical and mental wellness. Indeed, it is the presence of a strong recreational therapy program that will motivate residents to move more and engage with the world around them. This strongly correlates to improving depression and overall well-being.

In B.C., only 12 per cent of residential care clients received weekly physiotherapy, compared to 25 per cent in Alberta and 58 per cent in Ontario. Only 9 per cent of residents received occupational therapy, compared to 22 per cent in Alberta and 2 per cent in Ontario. Only 0.2 per cent received speech/language therapy, compared to 0.6 per cent of Alberta facility residents and 0.4 per cent of Ontario facility residents. Only 22 per cent of facility residents in B.C. received recreational therapy in the last seven days when surveyed, compared with 42 per cent in Alberta. Ontario only registered 7 per cent for this indicator; however, given their very high rate of physiotherapy, it is assumed there may be some substitution effect.

The Advocate is very troubled by this indicator and will begin working with health authorities and care facilities to look at ways to increase the use of rehabilitative therapies. This vital service will be subject to ongoing monitoring by the Advocate.

RAI indicator	Residential care population				
	B.C.	AB	ON		
Senior received any physiotherapy in last 7 days	11.6%	25.2%	57.7%		
Senior received any occupational therapy in last 7 days	8.9%	22.2%	1.8%		
Senior received any speech-language therapy in last 7 days	0.2%	0.6%	0.4%		
Senior received any recreational therapy in last 7 days	21.8%	42.3%	6.8%		

#### Incidence of rehabilitative therapy provision among the residential care population in B.C.

Therapy data is from 2013/14<sup>2</sup>

#### Summary

Bringing together the RAI data for B.C., reporting it, and comparing it to other provinces for the first time moves us closer to improving residential care and home care for B.C. seniors.

Through this first look at the data, we have learned that there is room to improve the supports for seniors in the community and meet the needs of some seniors who are moving to residential care prematurely.

We have learned that while B.C. has made some progress in the misuse of drugs in residential care, we are lagging behind other provinces and there is still room for improvement.

We have also learned that B.C. is woefully underperforming in the area of physical therapy, occupational therapy, speech language therapy and recreational therapy relative to some other provinces.

The Office of the Seniors Advocate will use these data to continue to monitor and report on the health status of, and supports for, our most frail and vulnerable seniors and to develop recommendations to support seniors in our province.
